RESULTS

The pedestrian survey began at the southeast corner at the top of the Project area and finished in the northwest corner at the base of the Project area. The terrain and environment of the survey area consisted of steeply sloped, sandy soils, devoid of historic or prehistoric materials. Recent staking to delineate the boundaries of the Project area were erected on the hillside. Electrical conduit is present on the northern edge of the driveway.

The Project area is currently occupied by young coast live oaks with trunk diameters no greater than 12-16 inches in diameter. Ground visibility was obstructed by oak leaves and low to medium vegetation. Soils are described lightly moist, coarse to medium grained sand, light gray to grayish brown (10YR 7/2-10YR 6/2) for a depth of at least 15-20 cm. Rodent krotovina are abundant and culturally sterile. The survey was completed with some difficulty due to the steep terrain.

No cultural soils or archaeological materials were observed during the survey.

RECOMMENDATIONS

Based on the results of the records search and pedestrian survey, we have concluded there is no surface evidence that significant archaeological resources will be impacted by the proposed Project. Additional testing and monitoring programs are not warranted for this Project and it should not be delayed for archaeological reasons.

PaleoWest recommends prior to construction activities, a qualified archaeologist provide the construction crew with a worker environmental awareness training (WEAP) to inform the process of unanticipated cultural resource discoveries.

Additionally, the following standard language, or equivalent thereof, should be included in any permits issued for the Project:

In the event any previously undiscovered prehistoric or historic cultural resources or are encountered during construction, all work shall be halted within 50 meters of the discovery until it can be evaluated by a qualified archaeologist. If the discovery is determined to be significant, appropriate mitigative action shall be implemented as determined necessary by the lead agency.

In the event that human remains are encountered on site, ground disturbing activities shall halt until the remains have been evaluated by the county coroner and an MLD has been assigned to the project.
