What is Prescribe Safe

Starting in 2014, the Monterey County Prescribe Safe Initiative was created to:

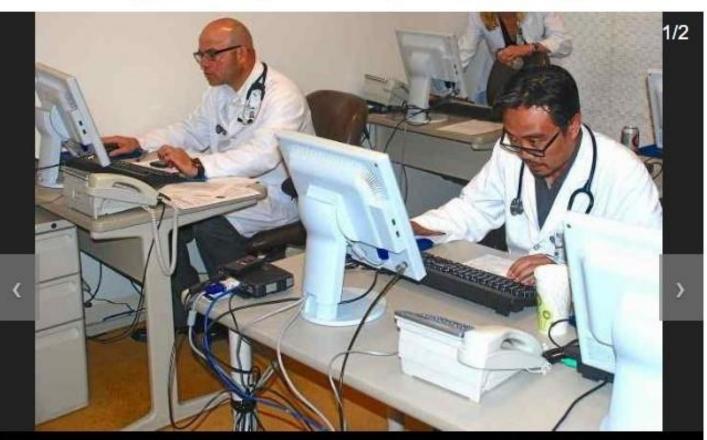

- Improve safety of prescription drugs
- Reduce inappropriate prescribing of prescription pain meds and sedatives
- Increase access to treatment for addiction
- Improve education of the public and the medical community on the dangers of prescription drugs

CHOMP unveils database that helps in battle against prescription drug abuse

Dr. Tuan Phan, right, a hospitalist, and Dr. Ismael Mendez, an internal medicine physician, register for the California Prescription Drug Monitoring Program Wednesday at Community Hospital of the Monterey Peninsula. (Tom Leyde - Herald Correspondent)

Community Hospital of the Monterey Peninsula® Emergency Department

HAZARDS OF OPLATES

As a part of your evaluation and treatment in the Emergency Department, you have been prescribed opiate pain medication.

Opiate pain medications such as hydrocodone (in Norco), or oxycodone (in Percocet and Oxycontin), are powerful pain relieving medications that can be valuable for patients suffering from an acute painful process like a broken bone or a kidney stone.

While these medications are important in the treatment of short-term pain, there are a number of important side effects that you need to know about.

SAFE PAIN MEDICINE PRESCRIBING

WE CARE ABOUT YOU. Our goal is to treat your medical conditions, including pain, effectively and safely. Pain relief treatment can be complicated. Mistakes or misuse of pain medicine can cause serious health problems to include **addiction and death.**

FOR YOUR SAFETY we routinely follow these rules when helping you with your pain.

- We look for and treat the underlying disease causing the symptom of pain. Sometimes that is a self-limiting injury, a terminal illness, permanent disability or a psychological disorder.
- We treat first or concurrently with non-medication modalities whenever possible to minimize your exposure to narcotic medications. These modalities may include physical treatments (physical therapy, massage, TENS unit, heat or cold therapy, exercise, etc.); behavioral approaches; or procedural therapies (injections by a pain specialist, surgery, etc.).
- I If a pain prescription is necessary, we will start with anti-inflammatory medications or other non-narcotics first. Alternatively, localized pain patches or roll-on medications may be tried instead of medications by mouth.
- If narcotic pain prescriptions are needed for pain, we will ONLY give you a limited amount at the lowest dose possible to achieve reasonable pain control. Absolute pain control at all times is not an appropriate or achievable target.
- In the rare circumstance where long-term use of narcotic medication is necessary you will be asked to engage in a monitoring contract to ensure safe use of your medication. This contract will require your active adherence to guidelines to limit the possibility of addictive behavior or misuse of your medications.
- I If you demonstrate characteristics of addiction, we will work with you to seek help in stopping the narcotics.
- We follow similar guidelines for other medications that are high risk for addiction. These medications include sleeping pills, anti-anxiety medications or mood stabilizing medications, muscle relaxants, etc.
- Concomitant use of sleeping pills, anti-anxiety or certain classes of mood stabilizing medications and narcotics can lead to a high risk of overdose. For your safety, your physician may refuse to start or continue these medications in combination.

Montage Medical Group

is a founding partner in the Monterey County Prescribe Safe Initiative. The Monterey County Prescribe Safe Initiative is dedicated to eliminating the epidemic of misuse, abuse and diversion of controlled prescription medications in Monterey County.

The Prescribe Safe initiative was created by Monterey County law enforcement, administration of the four Monterey County hospitals, and local physicians in response to concerns about prescription medication misuse in our county. Prescribe Safe is meant to guide, educate, and provide resources for our local physicians and patients in the safe use of prescription medications and promote safe and effective pain management in Monterey County. For questions regarding the Prescribe Safe initiative, please contact the team of practitioners at prescribesafe@chomp.org.

TENS Units in ED: Hope for the Opioid Epidemic?

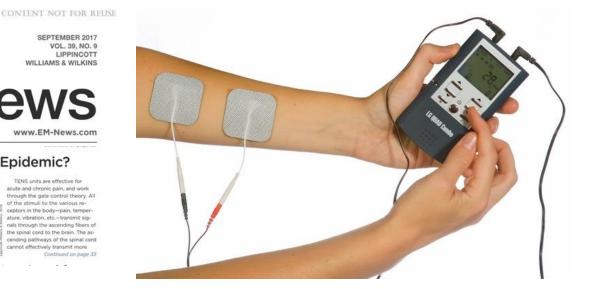

BY CASEY GROVER, MD

emergency physicians not to pre scribe as many addictive drugs, it may be time to do a little upconventional thinking when it comes to treating pain. Transcutaneous electrical nerve stimulation (TENS) therapy, an extremely useful and effective treatment for acute and chronic pain, offers a fantastic nonopioid pain management

TENS units are effective for acute and chronic pain, and work through the gate control theory. All of the stimuli to the various receptors in the body-pain, tempe ature vibration etc.-transmit signals through the ascending fibers of the spinal cord to the brain. The ascending pathways of the spinal cord cannot effectively transmit more Continued on page 33

February 13, 2017

Dear Colleague

Date:

This lefter is to inform you that you have prescribed a controlled substance within the last 12 months to a patient who recently presented to the Emergency Department with an overdose on a scheduled prescription medication (see attached documentation). All CURES system-identified prescribers are receiving this notification. This letter is meant to be informative only and there is no expectation of reply. Our aim is to aierf providers to how common overdose from overase of these medications is. In a recent Annais of Internal Medicine study, 17% of patients who were continued on opioids after an initial non-fatal overdose had a repeat overdose within two years.

Please do not consider this information about your patient a reason to fire them. If a patient has had an overdose due to a high-risk regimen, they need your help in tapering to a lower regimen. Cutting a patient off abruptly may result in withdrawai or encourage seeking medication in the street market. Furthermore, should your patient have a problem with addiction, this can be a time to partner with them to help them find treatment.

The Monterey Country Prescribe Safe Initiative (MCPSI) would like to remind you that California has a prescription drug monitoring program (CURES). This database and access to information are available at https://cures.doi.ca.gov/. Review of this database before prescribing a scheduled medication to a patient could alert you to problematic medication usage, potential addiction or diversion, and to help inform safe medication prescribing and monitoring.

Further, MCPSI has been working to improve the safety of controlled medication prescribing in our emergency departments, physician offices, and urgent cares. To achieve that goal we have developed resources that you can use in your own practice. These resources include up-to-date guides to chronic pain and addiction resources, clinical guidelines, medication management agreements and much more. These resources may be accessed at http://www.chomo.org/for-healthcare-professionals/presorbe-sate.

Lastly, MCPSI is working to ourb controlled medication diversion, prescription forgery, and other acts that contribute to the unlawful distribution and abuse of these dangerous and potentially fatal medications. As members of the MCPSI, the Monterey County Shertf and District Attorney offices are at the ready to address potential concerns you may have in this regard. They may be reached at (831) 759-6671 or (831) 755-6070.

We are aware of the challenges in balancing the potential harm and benefit of controlled medication prescribing for your patients and we hope this information will help. We believe that non-tatal overdose is an opportunity to identify and treat a serious substance use disorder or an unsafe pain medication regimen. Thank you for your time and for your help in making healthcare in Monterey County safer.

Regards.
